Career Objective

An Artificial Intelligence and Data Science engineering student with a strong foundation in Machine Learning and full-stack development. Passionate about crafting intelligent, data-driven solutions that integrate analytical depth with practical web technologies. Eager to contribute to innovative projects that solve real-world problems through the synergy of AI and modern software engineering.

Projects

1. Vehicle Routing Problem | Guided Project (Jan 8-Jan 9)

Objective: Optimized the Vehicle Routing Problem using Genetic Algorithms in DEAP, minimizing travel distance and time.

- Developed a solution for the Vehicle Routing Problem to optimize route planning for multiple vehicles.
- Utilized Genetic Algorithms in DEAP with a distance matrix and time-based fitness evaluation.
- Achieved minimized travel time and distance, ensuring efficient and effective routing.

2. Dimensionality-Reduction-Using-K-Means-for-Activity-Recognition | Guided Project (Jan 10)

Objective: Implemented K-Means clustering for dimensionality reduction in activity recognition, improving feature selection and model efficiency.

- Used K-Means clustering to identify and group redundant features in the activity recognition dataset.
- Selected key features by clustering and identifying the most informative ones.
- Trained a model using the reduced feature set, improving computational efficiency and maintaining accuracy.

3. Market Segmentation Using DBSCAN | Guided Project (Mar 9)

Objective: Segment customers based on spending behaviour and purchase frequency using DBSCAN, helping businesses with targeted marketing and customer retention.

- DBSCAN dynamically determines clusters instead of requiring a fixed number.
- Effectively segments **diverse customer groups** without assuming uniform distribution.
- Helps businesses **personalize offers, optimize marketing, and improve customer engagement** based on spending habits.

4. HealthTech – AI driven diabetes analysis | Guided Project (Mar 11)

Objective: Developed a machine learning model to analyse diabetes patient readmission patterns using the UCI Diabetes dataset, focusing on key health indicators, medication changes, and predictive analytics.

- Handled missing values with **KNN Imputation** and standardized features.
- Trained **Logistic Regression & Random Forest** for readmission prediction.
- Analysed **HbA1c impact, medication changes, and readmission trends** with **heatmaps & ROC curves**.

5. Typing Speed Test Web Application - A real-time typing performance evaluation | Self-Project (May 28)

Objective: To develop a web-based application that accurately measures typing speed and accuracy.

- Designed and implemented a responsive interface using **HTML, CSS, and JavaScript**.
- Features include dynamic **paragraph generation**, real-time **WPM calculation**, and **error tracking**.

Certificates

- Certified AWS Academy Cloud Foundations Graduate
- Certified in RDBMS PostgreSQL through the Spoken Tutorial Project by IIT Bombay, upon successful completion of the training and online examination
- Completed the MongoDB certification for Document Modelling on the official MongoDB platform.

Skills

Programming Languages: Python, Java, C

Web Development: HTML, CSS, JavaScript, React Js

Machine Learning: KNN, Genetic Algorithm, DEAP, NLP, DBSCAN

Soft Skills: Critical Thinking, Team Collaboration, Communication Skills, Leadership

Achievement

Selected for Ideathon Round – Girl Hackathon 2025 by Google

Qualified for Round 2 of Google's nationwide Girl Hackathon (SWE Track), based on performance in the initial selection round (Problem-Solving)
